

WHAT IS CLAIMED IS:

1. A controller for controlling interruption and restarting of data writing to a recording medium, wherein the data written to the recording medium is read from a buffer memory, the controller comprising:

an encoder connected to the buffer memory, wherein the encoder receives the data read from the buffer memory and encodes the read data to generate encoded data;

a synchronizing circuit for synchronizing the written data read from the recording medium with the encoded data when the writing of data to the recording medium is interrupted;

a first retry determination circuit for determining whether an address of the write data, which is read from the recording medium, and an address of the read data, which is provided to the encoder from the buffer memory, match;

a second retry determination circuit for determining whether a timing for reading the write data from the recording medium and a timing for encoding the read data match; and

a restart circuit for restarting the writing of data to the recording medium based on the determinations of the first and second retry determination circuits.

2. The controller according to claim 1, wherein the second retry determination circuit determines whether the timings match when the first retry determination circuit determines that the addresses match.

3. A controller for controlling interruption and restarting of data writing to a recording medium, wherein the data written to the recording medium is read from a

buffer memory, the controller comprising:

an encoder connected to the buffer memory, wherein the encoder receives the data read from the buffer memory and encodes the read data to generate encoded data;

5 one or more address memories connected to the buffer memory, wherein the one or more address memories store a write data address of the data written to the recording medium and a read data address of the data read from the buffer memory when the writing of data to the recording  
10 medium is interrupted, wherein the write data address and the read data address each indicate a location of the data when the interruption occurs;

a synchronizing circuit for synchronizing the written data read from the recording medium with the encoded data;

15 a first retry determination circuit for determining whether an address of the written data, which is read from the recording medium, and the write data address, which is stored in the one or more address memories, match, and for determining whether an address of the read data, which is  
20 provided to the encoder from the buffer memory, and the read data address, which is stored in the one or more address memories, match;

a second retry determination circuit for determining whether a timing for reading the written data from the  
25 recording medium and a timing for encoding the read data match; and

a restart circuit for restarting the writing of data to the recording medium based on the determinations of the first and second retry determination circuits.

30 4. The controller according to claim 3, wherein the written data read from the recording medium includes a first subcode synchronizing signal and the encoded data includes a

second subcode synchronizing signal, and wherein the second  
retry determination circuit determines whether the timing  
for reading the written data from the recording medium and  
the timing for encoding the read data match based on the  
first and second subcode synchronizing signals.

5           5.     The controller according to claim 3, wherein the  
second retry determination circuit determines whether the  
timings match when the first retry determination circuit  
determines that the addresses match.

10           6.     The controller according to claim 3, further  
comprising:

15           a first location detection circuit connected to the  
one or more address memories, wherein the first location  
detection circuit detects whether the address of the written  
data read from the recording medium matches the write data  
address stored in the one of more address memories; and

20           a second location detection circuit connected to the  
one or more address memories, wherein the second location  
detection circuit detects whether the address of the data  
read from the buffer memory matches the read data address  
stored in the one or more address memories.

25           7.     A controller for controlling interruption and  
restarting of data writing to a recording medium, wherein  
the data written to the recording medium is read from a  
buffer memory, the controller comprising:

30           an encoder connected to the buffer memory, wherein the  
encoder receives data read from the buffer memory and  
encodes the read data to generate encoded data;

          one or more address memories connected to the buffer  
memory, wherein the one or more address memories store a

write data address of the data written to the recording medium and a read data address of the data read from the buffer memory when the writing of data to the recording medium is interrupted, wherein the write data address and the read data address each indicate a location of the data when the interruption occurs;

a synchronizing circuit for synchronizing the written data read from the recording medium with the encoded data;

a retry determination circuit for determining whether an address of the written data, which is read from the recording medium, and the write data address, which is stored in the one or more address memories, match, and for determining whether an address of the read data, which is provided to the encoder from the buffer memory, and the read data address, which is stored in the one or more address memories, match, wherein the synchronizing circuit determines whether a timing for reading the written data from the recording medium and a timing for encoding the read data match; and

a restart circuit for restarting the writing of data to the recording medium based on the determinations of the retry determination circuit and the synchronizing circuit.

8. The controller according to claim 7, wherein the written data read from the recording medium includes a first subcode synchronizing signal and the encoded data includes a second subcode synchronizing signal, and wherein the synchronizing circuit determines whether the timing for reading the written data from the recording medium and the timing for encoding the read data match based on the first and second subcode synchronizing signals.

9. The controller according to claim 7, wherein the

synchronizing circuit determines whether the timings match when the first retry determination circuit determines that the addresses match.

5           10. The controller according to claim 7, further comprising:

10           a first location detection circuit connected to the one or more address memories, wherein the first location detection circuit detects whether the address of the written data read from the recording medium matches the write data address stored in the one of more address memories; and

15           a second location detection circuit connected to the one or more address memories, wherein the second location detection circuit detects whether the address of the data read from the buffer memory matches the read data address stored in the one or more address memories.
